

Voyager Converter Tool v2.1

UI Updates

General Options

- **Day Definitions Fix**
 - Resolved an issue where a hard-coded default value sets the day to “Wednesday” on startup. During loading defaults from `default_variables.txt`, the day value is updated but the UI was not refreshed, so unless changed, it runs with the new value.
 - **TransXChange Schema Options**
 - Added two new options for TransXChange XSD schema files (versions 2.1 and 2.4), used for validating TXC files during bus import.
-

Patch Bus Routes

- **Default Node & Link File Path**
 - Now uses `bus_node` and `bus_link` values from `default_variables.txt` to automatically populate “Node File” and “Link File” fields.
-

Import Updates

Bus Import

- **Day of Week Handling Fix**
 - Fixed issue where “MondayToSunday” or “MondayToFriday” values for day-of-week were not correctly handled in `data_transx.py`. Fix was already present in `data_transx_ncsd.py`
- **Missing Mode/Description Handling**
 - Fixed issue where a missing mode or description in the Service element would stop the import. Defaults now assigned (“bus” for mode, “No Description” for description); these values are not used elsewhere in the routine.
- **Operator Name Fix**
 - The `operator_dict` dictionary of Operator IDs within `data_transx.py` looked up the `OperatorShortName`, but in the case of Stagecoach, this meant no differentiation between the Stagecoach regions of Scotland. By changing this to look up the `TradingName`, the various Stagecoach operators were identified and `TradingName` for the other operators was just as valid to use as `OperatorShortName`.

- **Added TXC File Validation**
 - **Schema Validation:**
 - Checks if files are valid TXC format using the TransXChange XSD (2.1 or 2.4) depending on the TXC file header.
 - If minor issues identified which will not affect the import, these are reported in the UI as warnings even if the file is found not to be fully compliant.
 - If the file cannot be parsed or schema isn't found, the import for that file is aborted.
 - **Content Validation:**
 - Checks for required XML sections: "StopPoints", "Services", "JourneyPatternSections", "VehicleJourneys", and "Operators".
 - If expected child tags or fields within a section are missing these will be reported as a warning but will not stop the import attempting to process the file, these should be checked in the log in case data errors are present
 - **Additional Content Checks:**
 - **JourneyPatterns:** Ensures required fields "Direction" and "JourneyPatternSectionRefs" are present.
 - **JourneyPatternSections:** Ensures "JourneyPatternTimingLinks" exist, with "From", "To", and "RunTime" fields.
 - **VehicleJourneys:** Each must have "VehicleJourneyCode", "ServiceRef", and an "OperatingProfile" with a "RegularDayType".
 - **Reporting:**
 - Files with errors are **skipped**; errors are shown in red in the UI.
 - Warnings (issues that do not stop import) are shown in yellow.
- **Trip Route Extraction Fix**
 - Corrected the method to link JourneyPatternRef in /TransXChange/VehicleJourneys/VehicleJourney:
 - Formerly used as a direct lookup to /TransXChange/JourneyPatternSections/JourneyPatternSection (dependent on how operator has constructed TXC file).
 - **Correct method:** Lookup each JourneyPatternSection via /TransXChange/Services/Service/StandardService/JourneyPattern and then use JourneyPatternSectionRefs to create the complete route.
